

# ECE 2274 Reminders

1. **Lab partner:** You will work with your partner in each lab. But you need to work on your own in the final exam.
  - According to the previous semesters, student A in the group is always doing the experiments while student B is always responsible for the part of software. As a result, there are always about half of the students cannot finish the exam. **So please make sure both of you have sufficient chances to be familiar with the experiments as well as the software.**
2. **Experiment & theory:** Although a brief lecture will be given at the beginning of each lab, ECE 2274 will mainly focus on the physical experiments other than the theories behind. We may be a little bit ahead of the theoretical course (course you have in other classrooms). Therefore, you may want to use the resources of the course wisely to prepare for future labs.
  - Course website is the best tool for you to learn about this course. Besides, there are numerous course videos on YouTube for you to discover.
3. **Circuit components:** Before you build the circuits, **please** make sure you measure each of the component values. Remember, you cannot measure them after you put them in the circuit.
4. **Pre-labs:** Please make sure each plot is in a readable-resolution and has its title. Also, do not create your own answer sheets, you need to use the pre-lab answer sheets.
